Information Extraction from Images using Optical Character Recognition and Named Entity Recognition

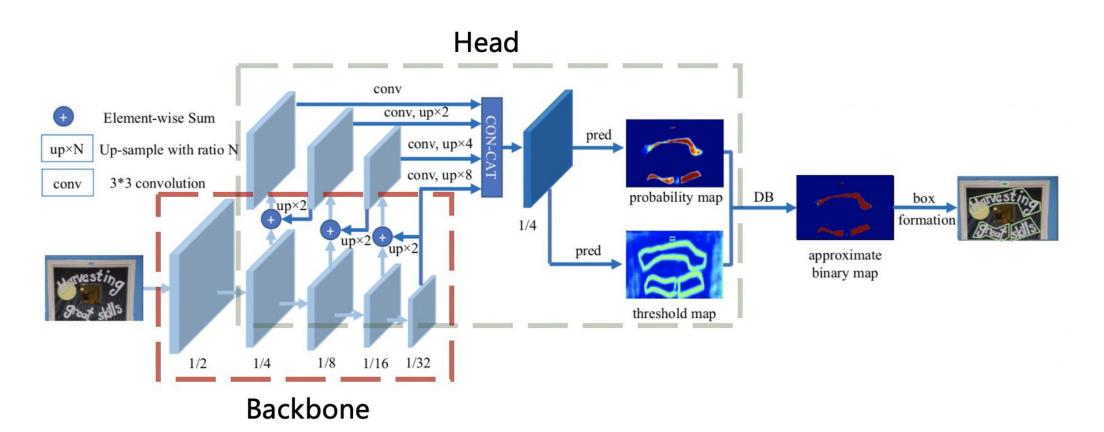

Anish Dixit, Neel Shah, Prerit Chaudhary

OPTICAL CHARACTER RECOGNITION

- OCR finds the coordinates of the character and also has to take in consideration spatial details, like baselining, spacing, variations in fonts, etc.
- Currently, many Deep learning-based text-extractors are being developed and have tackled even more variability in the input like noisy backgrounds and hand-written characters.
- In our use cases of digitized receipts and invoices, accurate identification of word clusters along with positional mapping.

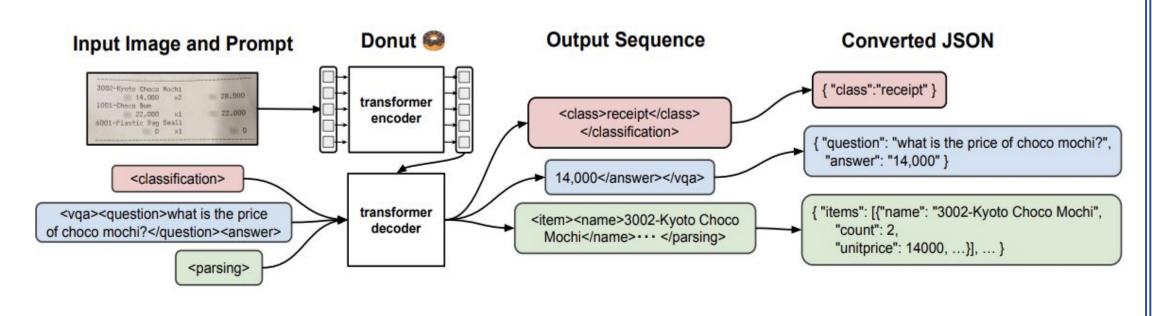

Approach 1: PaddleOCR

- PP-OCR is an practical ultra lightweight OCR System.
- Text Detection -> Detected Boxes Rectification -> Text Recognition
- Each process uses complex Convolutional Layered Networks.

Approach 1: DonutProcessor

- Donut consists of an image transformer encoder and an autoregressive text transformer decoder.
- Performs document understanding tasks such as document image classification, form understanding, and visual question answering.

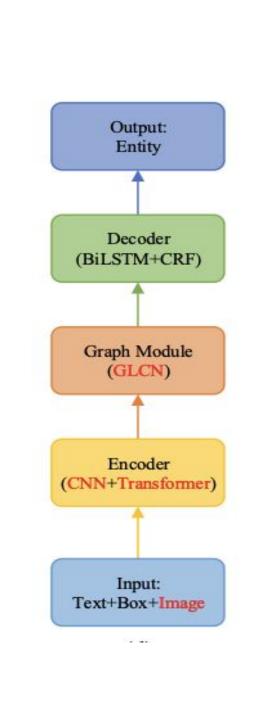

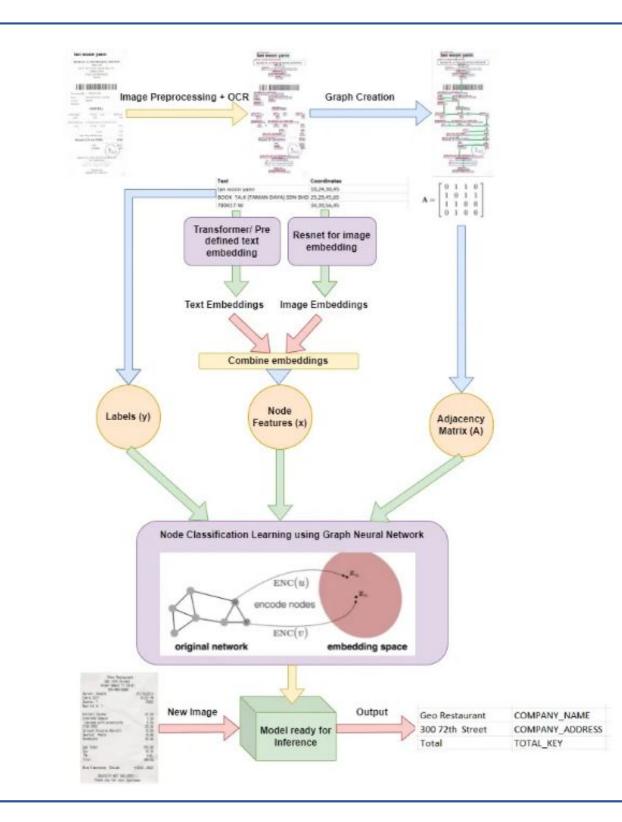

NAMED ENTITY RECOGNITION

- The goal of NER is to label names of people, places, organizations, and other entities of interest in text strings..
- There are three major approaches to NER: lexicon-based, rule-based, and machine learning based.
- Various Deep Learning models of varying complexities are getting better and better at classifying words into certain buckets.

Approach 2: CNN + Transformer + Graph Convolution

- Key Information Extraction from complex documents using Graph convolution neural networks.
- Information Extraction -> Graph -> Text Classification
- Encoder: CNN + Transformer = Generate text and Image Embeddings
- Graph learning + Graph convolution = Richer semantic representation containing the textual and visual features
- Decoder: BiLSTM + CRF = Text classification and Tagging
- GCN embeds node feature vectors to represent the input node as a point in an N-dimensional space mapping the similar neighbor nodes to classify the text into classes
